The engine options for 1998 Mustangs are the same as for the 1997 Mustang. The V6 Mustang continued to use a pushrod, or overhead valve style, engine while the GT and Cobra both used an overhead cam engine style. Though the engine displacement of the GT and the Cobra is identical, their actual layout is very different. The GT is a single overhead cam engine while the Cobra is a dual overhead cam configuration.

Additionally, the engine received larger fuel injectors and an increase in compression to 8.6:1. A 3.8 L (3,797 cc) V6 with split port cylinder heads was introduced in the 1996 Ford Windstar along with a variable length intake manifold and intake manifold runner control (IMRC) in the six shorter runners. This engine was rated at 200 hp (149 kW) at 5000 rpm and 230 lb·ft (312 N·m) of torque at 3000 rpm.

1) Mass of air that the engine breathes in + mass of fuel = mass of exhaust gases. Conservation of mass, right? 2) To calculate the volume of air the engine takes in, we multiply the displacement of the engine by the engine RPM and then divide by two (it takes two full revolutions for the engine to exhaust it’s entire air volume).

The chassis is virtually the same between 96 and 97, so physical fitment is not an issue. There are some differences between the 4V and 2V electronics. Off the top of my head, the 4V engine has a pair of knock sensors that the 2V doesn't, and has something akin to a variable intake (Intake Manifold Runner Control or IMRC).
