Exponential Growth and Decay Exponential decay refers to an amount of substance decreasing exponentially. Exponential decay is a type of exponential function where instead of having a variable in the base of the function, it is in the exponent.

Exponential decay and exponential growth are used in carbon dating and other real-life applications.

HW 3.3.1 Growth and Decay Problems

Examples of exponential decay are radioactive decay and population decrease. The information found can help predict what the half-life of a radioactive material is or what the population will be for a city or colony in the future.

Exponential Growth and Decay

Exponential Growth and Decay Exponential growth can be amazing! The idea: something always grows in relation to its current value, such as always doubling.

Example: If a population of rabbits doubles every month, we would have 2, then 4, then 8, 16, 32, 64, 128, 256, etc!

If the number in the bracket being raised to the $N/T/X$ is lower than 1, it is exponential decay. If it is higher than 1, it is growth. For example; $V(t) = 100(1.08)^T$ is exp. growth since as time goes on, 1.08^T will grow exponentially for increasing values of T .
