Farming Systems Research has three core characteristics: it builds on systems thinking, it depends on the close collaboration between social and biophysical sciences, and it relies on participation to build co-learning processes. Farming Systems Research posits that to contribute towards sustainable rural development, both interdisciplinary collaborations and local actor engagement are needed.

## *FARMING SYSTEMS APPROACH Introduction*

The term FSR/E in the broadest sense refers to any research and extension that views the farm in a holistic manner and considers interactions in a system (CGIAR, 1978). FSR is an approach to agricultural research and development that views the whole farm as a system and focuses on (i) The interdependencies between the components under the control of members of the household, and (ii) How these components interact with the physical, biological and socioeconomic

New findings suggest that more intensive agriculture might be the “least bad” option for feeding the world while saving its species – provided use of such “land-efficient” systems prevents further conversion of wilderness to farmland. Agriculture that appears to be more eco-friendly but uses more land may actually have greater environmental costs per unit of food than “high-yield” farming that uses less land, a new study has found.

Farming Systems Research and Extension (FSR/E) has strongly influenced the direction of agricultural development over the past two decades. Involving farmers, change agents and researchers, this participatory approach to technological improvement has evolved as an efficient means to develop individual components and more integrated systems that are uniquely suited to specific biophysical and socioeconomic conditions.

This larger effort, the Farming Systems Research (FSR) approach, emerged in the late 1970s as a response to the criticism that new agricultural technology was frequently irrelevant to small-scale farmers. FSR is a systematic attempt to involve small-scale farmers more actively in research and technology testing.
