In the railway sector and, more specifically, in the analysis of railway frame structures, the consideration of suspension systems (bogies) in its Finite Element Analysis becomes highly relevant: taking it into consideration may allow to characterise (in the most realistic way possible) the bogie rigidity transmitted to the frame structure, according to the requirements of the standard “UNE-EN 12663 (2014) Structural requirements of railway vehicle bodies”.

In order to study the influence of the rail seat abrasion, the concrete abrasion of concrete sleeper was simulated in the finite element model. The location and dimension of abrasion are shown in Fig. 12, the width of at the bottom of the abrasion is 150 mm (b), the same as the width of rail base. The depth (d) of abrasion is chosen as 10 mm, 20 mm and 30 mm, to analyze the influence of different abrasion degrees.
