Lecture 1 The

for Integrals

$$(1) \int_a^b f(x) dx = F(b)$$

- F(a). The best way

of computing an

integral is often to

find an

antiderivative F of

the given function f,

and then to use the

Fundamental

Theorem (1). How

you go about

finding an

antiderivative F for

Read Book

Lecture 1 The

Reduction
Formula And
Projection
Operator

some given function f is the subject of this chapter. The following notation is commonly used for antiderivates: (2) $F(x) = \int f(x)dx$.

~~MATH222~~

~~SECONDSEMESTER~~

~~CALCULUS~~

so the reduction

formula is: $\int x^n e^{ax} dx = \frac{1}{a} (x^n e^{ax} -$

$\int n x^{n-1} e^{ax} dx)$

Read Book

Lecture 1 The

Reduction

$$\int x^n e^{ax} dx = \frac{1}{a} \left(x^n e^{ax} - n \int x^{n-1} e^{ax} dx \right)$$

~~Integration by
reduction formulae—
Wikipedia~~

Reduction Formulas.
A reduction formula
for a given integral is

Read Book

Lecture 1 The

an integral which is of the same type as the given integral but of a lower degree (or order). The reduction formula is used when the given integral cannot be evaluated otherwise. The repeated application of the reduction formula helps us to evaluate the given integral.

Read Book

Lecture 1 The Reduction

~~7. Reduction
Formulas
Engineering~~

~~Mathematics [Book]~~

$x^n e^x = \int x^n e^x dx$ So,

if: $G_n(x) = \int x^n e^x dx$

then we get the

reduction formula: $G_n(x) = x^n e^x - n G_{n-1}(x)$:

Let 's illustrate this

by computing a few

integrals. First we

directly compute: $G_0(x) = \int e^x dx = e^x + C$

Let 's compute $G_1(x) = \int x e^x dx$

Read Book

Lecture 1 The

$$0(x) = \int x^0 e^x dx = e^x$$

+ c: Now we can use the reduction

formula to conclude

$$\text{that: } \int x^1 e^x dx = x e^x - \int e^x dx$$

$$0(x) = x e^x - e^x + c \text{ So } \int x e^x dx = x e^x - e^x + c.$$

$$\int x e^x dx = x e^x - e^x + c.$$

Question: How do you know when this method will work?
