Meteorology is the study of the atmosphere, atmospheric phenomena, and atmospheric effects on our weather. The atmosphere is the gaseous layer of the physical environment that surrounds a planet. Earth's atmosphere is roughly 100 to 125 kilometers (65-75 miles) thick. Gravity keeps the atmosphere from expanding much farther.

meteorology | National
Geographic Society

Meteorology concerns itself with the science of atmospheric properties and phenomena—science that includes the atmosphere's physics and chemistry.

Meteorologists are often thought

Atmosphere and the Science of Weather

Meteorology isn't the study of "meteors," but it is the study of *metéōros*, Greek for "things in the air." These "things" include phenomena that are bound by the atmosphere: temperature, air pressure, water vapor, as well as how they all interact and change over time -- which we collectively call "weather."

Why Should You Care About Weather and Meteorology?

Weather & atmosphere The term weather describes the state of the atmosphere at a given point in time and geographic location. Weather forecasts provide an estimate of the conditions we

Atmospheric pressure

Atmospheric pressure and wind are both significant controlling factors of Earth's weather and climate. Although these two physical variables may at first glance appear to be quite different, they are in fact closely related.

Atmosphere - MDPI

Meteorology is a branch of the atmospheric sciences which includes atmospheric chemistry and atmospheric physics, with a major focus on weather forecasting. The study of meteorology dates back millennia, though significant progress in meteorology did not occur until the 18th century. The 19th century saw modest progress in the field after weather observation networks were formed across broad ...
