and object oriented design metrics is an essential part of software environment. This study focus on a set of object oriented metrics that can be used to measure the quality of an object oriented design. The metrics for object oriented design focus on measurements that are applied to the class and design characteristics. These measurements permit designers to access the software

In 1994 Robert "Uncle Bob" Martin proposed a group of object-oriented metrics that are popular until now. Those metrics, unlike other object-oriented ones don't represent the full set of attributes to assess individual object-oriented design, they only focus on the relationship between packages in the project.

The focus of this book is on software metrics that are suited for evaluating and measuring object-oriented systems. The author starts with two introductory chapters. The first chapter reviews the characteristics of object-oriented systems development and makes clear the differences between this approach and more traditional ones.

Object-oriented (OO) metrics are an integral part of object technology at the research level and in commercial software development projects. This book offers theoretical and empirical tips and facts for creating an OO complexity metrics (measurement) program, based on a review of existing research from the last several years.

Chidamber & Kemerer object-oriented metrics suite. Project Metrics. The Chidamber & Kemerer metrics suite originally consists of 6 metrics calculated for each class: WMC, DIT, NDC, CBO, RFC and LCOM1. The original suite has later been amended by RFC', LCOM2, LCOM3 and LCOM4 by other authors. See also Object-oriented metrics. WMC Weighted Methods Per Class

The Measure-Object cmdlet performs calculations on the property values of objects. You can use Measure-Object to count objects or count objects with a specified Property. You can also use Measure-Object to calculate the Minimum, Maximum, Sum, StandardDeviation and Average of numeric values. For String objects, you can also use Measure-Object to count the number of lines, words, and characters.

Object oriented analysis, design, and implementation are an iterative process. It is usually impossible to fully and correctly design the classes of an OO system at the outset of a project. Booch proposes five metrics to measure the quality of classes: Coupling; Cohesion; Sufficiency; Completeness; Primitiveness; Coupling

Object oriented metrics are used to measure properties of object oriented designs. Object-oriented software metrics provide such quantitative view about the implementation of object-oriented constructs in software design for the improvement of the software quality. The necessary features of the preferred object oriented metrics are recognized as capability of covering all
