Clayden, Warren, & Greeves (2012) states explicitly on p. 231 that imine formation requires acid catalysis, and that the reaction takes place optimally under slightly acidic conditions, close to neutrality. This makes sense as we need to form the -OH_2^+ allowing water to leave.

This volume, number 23 in the
"Tetrahedron Organic Chemistry" series,

Online Library Organic Chemistry By Clayden

presents organolithium chemistry from the perspective of a synthetic organic chemist, drawing from the synthetic literature to present a unified overview of how organolithiums can be used to make molecules. The development of methods for the regioselective synthesis of organolithiums has replaced their image of

Online Library Organic Chemistry By Clayden

indiscriminate high reactivity with one of
controllable and subtle selectivity.

Organolithium chemistry has a central role
in the selective construction of C-C bonds
in both simple and complex molecules, and
for example has arguably overtaken
aromatic electrophilic substitution as the
most powerful method for regioselective

functionalisation of aromatic rings. The twin themes of reactivity and selectivity run through the book, which reviews the ways by which organolithiums may be formed and the ways in which they react. Topics include advances in directed metallation, reductive lithiation and organolithium cyclisation reactions, along with a discussion
