but monocots are mentioned for comparison. After reviewing the cells and tissues that make up a flowering plant, you will explore the growth and structure of the three vegetative organs of a plant: the root, stem, and leaf.

They grow through a combination of cell growth and cell division (mitosis). The key to plant growth is meristem, a type of plant tissue consisting of undifferentiated cells that can continue to divide and differentiate.

# Bookmark File PDF Plant Structure And Growth

Meristem allows plant stems and roots to grow longer (primary growth) and wider (secondary growth).
