Quadrature Signals: Complex, But Not Complicated

A quadrature signal is a two-dimensional signal whose value at some instant in time can be specified by a single complex numberhaving two parts; what we call the realpart and the imaginarypart. (The words real and imaginary, although traditional, are unfortunate because of their meanings in our every day speech.

Quadrature Signals: Complex, But Not Complicated

Quadrature Signals: Complex, But Not Complicated Understanding complex numbers and quadrature signals is essential for understanding DSP at both a theoretical and a practical level. Yet this strange, complex subject (based on the admittedly imaginary construct of the square root of negative one!) is among the hardest for DSP beginners to grasp – and is confusing at times even for advanced DSPers.

Quadrature signals are based on the notion of complex numbers and perhaps no other topic causes more heartache for newcomers to DSP than these numbers and their strange terminology of j operator, complex, imaginary, real, and orthogonal. If you're a little unsure of the physical meaning of complex numbers and the $j = \sqrt{-1}$ operator, don't feel bad because you're in good company.

A Quadrature Signals Tutorial: Complex, But Not Complicated

Complex down-conversion of discrete signal is a straightforward process, and best described by an example. Think of a real-valued discrete sequence $x(n)$ having an $|X(m)|$ spectral magnitude whose non-zero-valued samples are shown as the solid dots in Figure 8-14(a).

COMPLEX DOWN-CONVERSION | Chapter Eight. Quadrature Signals

Richard Lyons explains this carefully in his very interesting piece on "Quadrature Signals: Complex but not complicated". Quadrature signals have a very interesting application in signal processing. By using both the in-phase and quadrature components of a sampled signal it is possible to actually double the acquired bandwidth from the Nyquist limit $f_s/2$ to f_s . The matlab example code serves as an example for this. The local oscillator is set at 400 Hz

In electrical engineering, a sinusoid with angle modulation can be decomposed into, or synthesized from, two amplitude-modulated sinusoids that are offset in phase by one-quarter cycle ($\pi/2$ radians). All three functions have the same center frequency.The amplitude modulated sinusoids are known as the in-phase and quadrature components. In some contexts it is more convenient to refer to only ...

In-phase and quadrature components - Wikipedia

In signal processing ; Quadrature amplitude modulation (QAM), a modulation method of using both an (in-phase) carrier wave and a 'quadrature' carrier wave that is 90° out of phase with the main, or in-phase, carrier Quadrature phase, oscillations that are said to be in quadrature if they are separated in phase by 90° ($\pi/2$, or $\pi/4$)

Complex filters use the I and Q (quadrature) signals which are extracted after the down-conversion of the modulated RF signal, by means of an LO which offers two phases 0° and 90° of the same...

Complex signal processing is not - Complex

Quadrature signals, also called IQ signals, IQ data or IQ samples, are often used in RF applications. They form the basis of complex RF signal modulation and demodulation, both in hardware and in software, as well as in complex signal analysis. This post looks at the concept of IQ signals and how they are used.

(That rotating $e^{j2\pi f t}$ complex number goes by two names in the DSP literature; it's often called a "complex exponential", and it's also referred to as a "quadrature signal.") If, say, the frequency $f_0 = 2$ Hz then the solid dot would rotate around the circle two times, or two cycles, per second. Figure 4.

In reality the signals from the I and Q channels are not phase-shifted exact copies of one another because they also contain noise. Unlike the signals, noise in the two channels is independent and uncorrelated. Thus quadrature detection offers an increase in signal-to-noise by a factor of $\sqrt{2} = 1.41$ over detection by a single linear receiver. ...

The motion of the complex signal as time increases. To appreciate the physical meaning of our discussion here, let's remember that a continuous quadrature signal = $\cos(2\pi f_0 t) + j\sin(2\pi f_0 t)$ is not just mathematical mumbo jumbo. We can generate in our laboratory and transmit it to another lab down the hall.

Quadrature detection is a common technique for demodulating radio and microwave signals in which the signal is demodulated to form two orthogonal components. Complex envelope notation is a compact method of representing the modulation of a real signal in complex form.
