This study provides evidence that measures of taste sensitivity and PR for some types of taste are correlated. In particular, higher sensitivities to salt, sweet, and umami taste are associated with decreases in the preferences for these tastes whereas fat and sour preferences were not associated with corresponding taste sensitivities.

~~Taste Sensitivity and Taste Preference Measures Are ...~~

A simple measure of taste sensitivity can be obtained by counting the number of fungiform papillae on the tip of the tongue. The technique given here was developed by Linda Bartoshuk, Yale University. Subjects swab the tip of their tongue with a cotton swab (e.g., a Q-tip) dipped in a dilute solution of methylene blue (or blue food coloring).

Studies On Sensitivity Of Taste And Eating Behavior Of While much of the research effort is focused on how the body uses and stores energy, NIDCD-supported research is uncovering valuable clues through studies on the sense of taste. Studies on Page 5/11.

~~Studies On Sensitivity Of Taste And Eating Behavior Of~~

The volatility of substances is increased at higher temperatures, and so they smell stronger. Taste bud receptivity is also an important factor. Taste buds are most receptive in the region between 68 and 86 degree F and so tastes will be more intense in this temperature range. Psychological factors also affect taste sensitivity and perception.

~~Studies On Sensitivity Of Taste And Eating Behavior Of |~~

For example, studies have found that obese patients may experience decreased taste sensitivity. Researchers hypothesize that people with a dulled sense of taste might then be tempted to seek out foods that are richer in sugar, salt, and fat, or to consume more to achieve the same level of sensation that someone who is a recommended weight might feel.
