and layered. A monolithic device driver represents one piece of hardware (a data-acquisition board, for instance), while a layered driver sits on top of another driver (or between two drivers) forming a hierarchy. SCSI and network drivers are examples of layered drivers. Device drivers run in NT's kernel mode, while applications run in user mode.

I/O request packets (IRPs) are kernel mode structures that are used by Windows Driver Model (WDM) and Windows NT device drivers to communicate with each other and with the operating system. They are data structures that describe I/O requests, and can be equally well thought of as "I/O request descriptors" or similar.
