The current USEPA approach to controlling discharge of pollutants to receiving water bodies, and thereby preserving and improving water quality, is also covered. This information can be used as a foundation for the design of wastewater treatment and discharge.

Environmental engineers devise solutions for wastewater management, water and air pollution control, recycling, waste disposal, and public health. [2] [3] They design municipal water supply and industrial wastewater treatment systems, [4] [5] and design plans to prevent waterborne diseases and improve sanitation in urban, rural and recreational ...

Environmental engineering - Wikipedia

Though plentiful, the water resources of the state are threatened by chemical contaminants and other pollutants from a wide range of sources. The Division of Water provides various programs that track the quality of the waters, identify and investigate sources of pollution, control these sources and develop strategies to address water quality threats.

The title of this book is Water Supply and Pollution Control and it was written by Warren Viessman Jr., Mark J. Hammer, Elizabeth M. Perez. This particular edition is in a Hardcover format. This books publish date is Jun 09, 2008 and it has a suggested retail price of \$239.99. It was published by Pearson and has a total of 864 pages in the book.

For upper-division undergraduate or beginning graduate courses in civil and environmental engineering, this text has been revised and modernised to meet the needs of today's environmental engineering students who will be engaged in the design and management of water and wastewater systems.

"Water Supply and Pollution Control," Seventh Edition has been revised and modernized to meet the contemporary needs of civil and environmental engineering students who will be engaged in the design and management of water and wastewater systems, practicing engineers, and those planning to take the examination for licensing as a professional engineer. Warren Viessman, Jr. and Mark J. Hammer emphasize the application of scientific methods to problems associated with the development, movement, and treatment of water and wastewater. Treatment processes are presented in the context of what they can do, rather than compartmentalizing them along clean water or wastewater lines. The concept of total water management, recognizing that all waters are potential sources of supply, is a dominant theme. Improvements in the seventh edition include New material on water quality standards, water and wastewater treatment process design, water distribution system analysis and design, water quality, advanced wastewater treatment for recycling, storm water management and urban hydrology Major revisions of the sections on water supply and use, water distribution, hydraulics and hydrology of sewer and storm drainage systems, monitoring of drinking water for pathogens, membrane filtration, disinfection/disinfection by-products rule, biological treatment processes, and indirect reuse to augment drinking water supply The latest version of EPANET is introduced. distribution network model offers students an opportunity to address problems of all scale and to become acquainted with state-of-the-art software used by practitioners. New topics such as security of potable water supplies, the use of membranes in water treatment, and the application of Geographical Information Systems (GIS) to water supply and wastewater management problems have been introduced. More practical examples and many new problems have been added.

Suitable for university undergraduate courses but also serves as a useful reference book for graduate students and practicing engineers.

This report presents the results of a study of the problem of water supply and waste disposal in the three-State, six-county region in which the Tocks Island Reservoir and the Delaware Water Gap National Recreation Area are being developed. Peak summer populations are projected over a 50-year period and utilities systems alternatives which could accommodate such projected growth are presented in the report. Water supplies in the region are seen as adequate to meet future demands, with heavy emphasis on development of groundwater resources. Five alternative sewerage plans, ranging in degree of regionalization from 116 local treatment systems to a single system for the entire region, are outlined including detailed cost estimates. Preservation of water quality in the region is a primary objective of the study.
